Instructions to Students

Please read the detailed Guidelines on Internship hosted on the website of AP State Council of Higher Education https://apsche.ap.gov.in

1. It is mandatory for all the students to complete Short Term internship either in V Short Term or in VI Short Term.
2. Every student should identify the organization for internship in consultation with the College Principal/the authorized person nominated by the Principal.
3. Report to the intern organization as per the schedule given by the College. You must make your own arrangements for transportation to reach the organization.
4. You should maintain punctuality in attending the internship. Daily attendance is compulsory.
5. You are expected to learn about the organization, policies, procedures, and processes by interacting with the people working in the organization and by consulting the supervisor attached to the interns.
6. While you are attending the internship, follow the rules and regulations of the intern organization.
7. While in the intern organization, always wear your College Identity Card.
8. If your College has a prescribed dress as uniform, wear the uniform daily, as you attend to your assigned duties.
9. You will be assigned a Faculty Guide from your College. He/She will be creating a WhatsApp group with your fellow interns. Post your daily activity done and/or any difficulty you encounter during the internship.
10. Identify five or more learning objectives in consultation with your Faculty Guide. These learning objectives can address:
    a. Data and information you are expected to collect about the organization and/or indus- try.
    b. Job skills you are expected to acquire.
    c. Development of professional competencies that lead to future career success.
11. Practice professional communication skills with team members, co-interns, and your supervisor. This includes expressing thoughts and ideas effectively through oral, written, and non-verbal communication, and utilizing listening skills.
12. Be aware of the communication culture in your work environment. Follow up and communicate regularly with your supervisor to provide updates on your progress with work assignments.

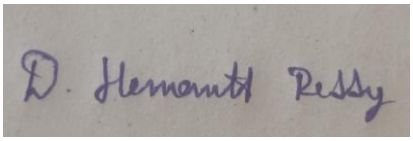

Instructions to Students (contd.)

13. Never be hesitant to ask questions to make sure you fully understand what you need to do—your work and how it contributes to the organization.
14. Be regular in filling up your Program Book. It shall be filled up in your own handwriting. Add additional sheets wherever nMechanical engineeringssary.
15. At the end of internship, you shall be evaluated by your Supervisor of the intern organiza- tion.
16. There shall also be evaluation at the end of the internship by the Faculty Guide and the Principal.
17. Do not meddle with the instruments/equipment you work with.
18. Ensure that you do not cause any disturbance to the regular activities of the intern organi- zation.
19. Be cordial but not too intimate with the employees of the intern organization and your fellow interns.
20. You should understand that during the internship programme, you are the ambassador of your College, and your behavior during the internship programme is of utmost importance.
21. If you are involved in any discipline related issues, you will be withdrawn from the internship programme immediately and disciplinary action shall be initiated.
22. Do not forget to keep up your family pride and prestige of your College.

Student's Declaration

I, **MR.DURGASI HEMANTH REDDY**, a student of **Bachelor of Technology** Program, Reg. No. **324129520068** of the Department of **Mechanical engineering** do hereby declare that I have completed the mandatory internship from **21-05-2026** to **21-07-2026** at **Council for Skills and Competencies (CSC India)** under the Faculty Guideship of **Mr.N.RAJU**, Department of **Mechanical engineering**, **Wellfare Institute of Science, Technology and Management**.

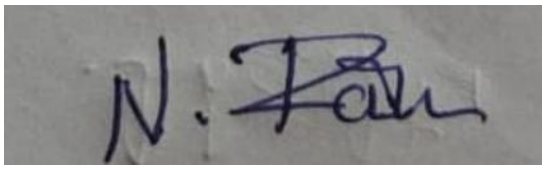

(Signature and Date)

Official Certification

This is to certify that **MR.DURGASI HEMANTH REDDY** , Reg. No. **324129520068** has completed his/her Internship at the Council for Skills and Competencies (CSC India) on **ONLINE COURSE COMPLETION PREDICTION SYSTEM BASED ON STUDENT LEARNING ACTIVITIES AND ENGAGEMENT METRICS** under my supervision as a part of partial fulfillment of the requirement for the Degree of **Bachelor of Technology** in the Department of **Mechanical engineering** at **Wellfare Institute of Science, Technology and Management**.

This is accepted for evaluation.

Endorsement

Faculty Guide

Head of the Department

Principal

Certificate from Intern Organization

This is to certify that **MR.DURGASI HEMANTH REDDY**, Reg. No. **324129520068** of **Wellfare Institute of Science, Technology and Management**, underwent intern- ship in **ONLINE COURSE COMPLETION PREDICTION SYSTEM BASED ON STUDENT LEARNING ACTIVITIES AND ENGAGEMENT METRICS And Sentiment Analysis For Social Media Applications** at the **Council for Skills and Competencies (CSC India)** from **21-05-2026 to 21-07-2026**.

The overall performance of the intern during his/her internship is found to be **Satisfactory** (Satisfactory/~~Not Satisfactory~~).

Authorized Signatory with Date and Seal

Acknowledgement

I express my sincere thanks to **Dr. A. Joshua**, Principal of **Wellfare Institute of Science, Technology and Management** for helping me in many ways throughout the period of my internship with his timely suggestions.

I sincerely owe my respect and gratitude to **Mr.R.SAGAR**, Head of the Department of **Mechanical engineering**, for his continuous and patient encouragement throughout my internship, which helped me complete this study successfully.

I express my sincere and heartfelt thanks to my faculty guide **Mr.N.RAJU**, Assistant Professor of the Department of **Mechanical engineering** for his encouragement and valuable support in bringing the present shape of my work.

I express my special thanks to my organization guide **Mr. Y. Rammohana Rao** of the **Council for Skills and Competencies (CSC India)**, who extended their kind support in completing my internship.

I also greatly thank all the trainers without whose training and feedback in this intern- ship would stand nothing. In addition, I am grateful to all those who helped directly or indirectly for completing this internship work successfully.

CHAPTER 1

EXECUTIVE SUMMARY

This internship report provides a comprehensive overview of my internship focused on developing an Online Course Completion Prediction System based on Student Learning Activities and Engagement Metrics. The internship spanned an 8-week period and was undertaken to apply advanced machine learning methodologies to the educational technology (EdTech) sector, specifically addressing the critical need for early identification of at-risk learners. The primary objective of this internship was to gain proficiency in predictive learning analytics, feature engineering, and classification algorithms while solving a major challenge in online education.

1.1 Learning Objectives

During my internship, I learned and practiced the following:

- To design and implement a machine learning system using Python and Scikit-learn that can accurately predict the probability of a student completing an online course based on their engagement metrics.

- To understand and process complex educational data, specifically focusing on extracting and utilizing key behavioral indicators such as login frequency, course progress, quiz performance, and discussion participation.

- To evaluate and compare different classification architectures, including Logistic Regression, Random Forest, and Gradient Boosting, to determine the most effective algorithm for student success prediction.

- To implement robust evaluation metrics suitable for educational intervention, prioritizing high recall to ensure no at-risk student is missed by the prediction system.

• To design an automated analytical pipeline that generates interpretable visual reports, allowing instructors and administrators to understand the specific factors driving student engagement and success.

1.2 Outcomes Achieved

Key outcomes from my internship include:

• A fully operational predictive engine capable of evaluating student engagement data, utilizing Scikit-learn feature engineering and ensemble learning on a diverse behavioral dataset.

• Educational institutions and e-learning platforms can utilize this automated prediction logic as an early warning system, significantly improving the timeliness of academic interventions.

• Comprehensive data visualizations including completion distributions, model performance comparisons, ROC curves, and engagement analytics that enhance the interpretability of the ML models for educators.

• A robust feature engineering pipeline that successfully quantifies learning consistency and activity recency alongside traditional assessment metrics.

• The prediction system establishes a foundation that can be extended with deep learning architectures for real-time, personalized learning recommendations in complex educational environments.

These outcomes directly address the problem statement by providing a modern and intelligent learning analytics solution that improves course completion prediction, supports personalized learning, enables early intervention, and enhances student success.

The successful implementation of this system demonstrates the powerful intersection of artificial intelligence and educational technology. By moving away from purely summative assessment methods and toward automated, machine learning-driven

behavioral assessment, educational institutions can proactively manage student support, potentially revolutionizing how online platforms optimize learning outcomes.

CHAPTER 2

OVERVIEW OF THE ORGANIZATION

2.1 Introduction of the Organization

The organization hosting this internship is a leading educational technology solutions provider focused on bridging the gap between Machine Learning research and practical e-learning applications, enhancing student success rates, and promoting innovation in the EdTech sector. By leveraging emerging technologies such as Predictive Learning Analytics and Student Behavior Modeling, the organization aims to augment the digital education ecosystem, enabling educators and institutions to utilize intelligent tools for proactive academic intervention.

The organization's collaborations with prominent universities and online learning platforms underscore its value and credibility in the EdTech sector. Through projects like the Online Course Completion Prediction System, the organization demonstrates its commitment to applying cutting-edge AI to solve pressing operational challenges, specifically within the realm of student retention and success.

2.2 Vision, Mission, and Values

- **Vision:** To combine cutting-edge Machine Learning science with impactful educational solutions to drive learning efficiency and automated student support in global digital learning ecosystems.

- **Mission:** To support organizations dedicated to online education by empowering and equipping educators with intelligent predictive tools, thereby creating a highly supportive, data-driven learning environment.

- **Values:** The organization emphasizes analytical skills for the knowledge economy, algorithmic accuracy, strict student data privacy, and ethical AI development for transparent academic support.

2.3 Policy of the Organization in Relation to the Intern Role

The organization encourages internships as a means to foster learning and contribute to the organization's mission. Interns are expected to adhere to the following policies:

- **Confidentiality and FERPA Compliance:** Interns must maintain the strict confidentiality of all organizational and proprietary student behavior data, adhering to educational privacy standards (e.g., FERPA, GDPR).

- **Professionalism:** Interns are expected to demonstrate professionalism, punctuality, and respect for all team members, data engineers, and educational mentors.

- **Learning and Contribution:** Interns are encouraged to actively participate in projects, share innovative ideas regarding ML applications in education, and contribute to the organization's goals.

- **Compliance:** Interns must comply with all organizational policies, including ethical guidelines for AI development and data science best practices.

2.4 Organizational Structure

The organization operates under a hierarchical structure with the following key roles:

- **Board of Directors:** Provides strategic direction and oversight for EdTech and ML initiatives.

- **Executive Director:** Oversees day-to-day operations and implementation of educational technology programs.

- **Project Managers:** Lead specific initiatives such as the development of predictive software and student success tools.

- **Data Science Team:** Conducts research, develops machine learning models, and engages in technical innovation for learning analytics.

• **Academic Advisory Board:** Provides domain expertise to ensure algorithms align with current pedagogical strategies and educational goals.

• **Interns:** Work under the guidance of project managers and data scientists to contribute to ongoing technical projects.

2.5 Roles and Responsibilities of the Employees Guiding the Intern

Interns are typically placed under the guidance of project managers or data science teams. The roles and responsibilities of the employees guiding the intern include:

1. Project Managers:

• Design and implement technical EdTech projects.

• Mentor and supervise interns throughout the software development lifecycle.

• Coordinate with academic stakeholders to gather prediction requirements for intervention tools.

2. Data Scientists:

• Conduct research on ML algorithms for behavioral modeling and feature engineering.

• Prepare complex student interaction datasets and prediction pipelines.

• Analyze data and provide technical recommendations for model optimization to maximize completion prediction accuracy.

Interns assist these teams by conducting research, drafting technical documents, developing Python code, and supporting ML data analysis efforts. The collaborative environment ensures that interns receive comprehensive training in both theoretical concepts and practical implementation of AI systems within the highly dynamic context of educational technology.

CHAPTER 3

PROBLEM ASSESSMENT

3.1 Problem Analysis

Online learning platforms serve millions of students worldwide, making it challenging to identify learners who are likely to discontinue or fail to complete their courses. Traditional monitoring methods rely on manual observation and final assessment results, making early intervention difficult. Educational institutions and e-learning providers require intelligent systems that can analyze student engagement and predict course completion to improve learning outcomes.

Traditional student monitoring methods face several systemic limitations:

- Reactive Assessment: Relying solely on midterm or final exam grades identifies struggling students too late for effective intervention.
- Scale Constraints: Human instructors cannot manually monitor the daily engagement metrics of thousands of online learners simultaneously.
- High Attrition Rates: Without timely support, online courses often suffer from high dropout rates, negatively impacting both students and institutions.
- Lack of Behavioral Insight: Basic systems often ignore critical behavioral factors such as login frequency, video viewing patterns, and discussion participation.

Consequently, the educational technology sector requires intelligent, automated systems that can analyze raw learning data, extract behavioral patterns, and apply Machine Learning to predict student success objectively and instantaneously.

3.2 Key Parameters

To accurately predict course completion, the machine learning system must evaluate several intersecting behavioral and academic parameters extracted from the Learning Management System (LMS):

• Engagement Metrics: Login frequency per week, video viewing hours, and days since last activity, indicating the student's active presence in the course.

• Academic Performance: Quiz average scores and the number of assignments submitted, reflecting the student's mastery of the material.

• Course Progress: The percentage of the course completed, serving as a direct indicator of momentum.

• Interaction Levels: The number of discussion posts, representing social learning and peer engagement.

• Learning Consistency: A calculated score reflecting the regularity of the student's study habits.

• Student Profile: Age and prior experience level, which provide baseline context for the learning journey.

3.3 Requirements Evaluation

The proposed Online Course Completion Prediction System must meet specific functional and non-functional requirements to address the educational intervention challenge effectively.

Functional Requirements:

• Data Integration: The system must accept and process tabular data containing student LMS interactions and academic metadata.

• Feature Engineering Engine: The system must utilize Pandas and Scikit-learn to transform categorical variables and calculate consistency metrics.

• Prediction Reporting: The system must generate detailed analytical reports estimating the probability of completion for specific students.

• Intervention Analytics: The system must output specific classifications with a high recall rate to ensure at-risk students are identified.

• Visualization: The system must generate visual dashboards illustrating the distribution of engagement features and the performance of the predictive models.

Non-Functional Requirements:

• High Recall: The system must achieve a high recall rate (minimizing false negatives) to ensure that students needing help are not overlooked.

• Interpretability: The system should provide clear explanations (e.g., feature importance) for what behavioral factors are driving the at-risk prediction.

• Robustness: The models must maintain accuracy across diverse course subjects and handle variations in student behavior.

• Scalability: The architecture must be capable of processing large batches of LMS interactions for institution-wide analytics.

By mapping these requirements directly to the identified behavioral parameters, the solution ensures a comprehensive and effective approach to modern learning analytics. The reliance on data-driven ML algorithms directly addresses the limitations of legacy, reactive educational monitoring.

CHAPTER 4

SOLUTION DESIGN

4.1 Solution Blueprint

The Online Course Completion Prediction System is designed as a modular Machine Learning pipeline that transforms raw LMS data into accurate predictions and actionable educational insights. The blueprint consists of three primary components:

1. Data Generation and Preprocessing Module:

This component is responsible for creating a robust dataset that mimics actual LMS logs. It includes a synthetic data generator that models complex learning behaviors: generating engagement metrics, academic performance, and consistency scores. The preprocessing pipeline utilizes Pandas to encode categorical variables (e.g., one-hot encoding for Prior Experience), handle missing values, and prepare the feature matrix for modeling.

2. Predictive Modeling Engine:

This is the core analytical component. It implements advanced mathematical techniques to analyze behavior and predict course completion:

- Logistic Regression: A baseline linear model that provides highly interpretable probabilities for completion likelihood.
- Random Forest Classifier: An ensemble learning method that constructs multiple decision trees. It is highly effective at capturing non-linear interactions between learning features (e.g., login frequency and quiz scores).
- Gradient Boosting Classifier: An advanced ensemble technique that builds trees sequentially to correct errors of previous trees, providing robust predictive accuracy for tabular educational data.

3. Analytics and Visualization Dashboard:

This component translates the mathematical outputs of the models into interpretable educational intelligence. It generates comprehensive visual reports, including completion distributions by feature, classification confusion matrices, ROC curves to analyze model robustness, and feature importance charts.

4.2 Feasibility Assessment

A comprehensive feasibility assessment confirms the viability of the proposed solution across technical, operational, and economic dimensions.

Technical Feasibility: The project is highly technically feasible. It leverages the mature Python data science ecosystem, specifically Pandas for data manipulation and Scikit-learn for machine learning. These libraries provide robust, optimized implementations of the required extraction and classification algorithms, ensuring that the system can handle the complexity of educational data.

Operational Feasibility: The system is operationally feasible as it addresses a universal need in online education. The automated nature of the prediction engine means it can be integrated into existing LMS platforms (like Canvas or Moodle), acting as an automated early warning system that evaluates student progress continuously.

Economic Feasibility: The project is economically sound. By utilizing open-source Python libraries, the development avoids expensive proprietary analytics software licenses. Furthermore, the system provides massive economic value to institutions; improving retention rates directly impacts institutional revenue and enhances the overall reputation of the educational provider.

4.3 Implementation Plan

The development of the Online Course Completion Prediction System followed a structured implementation plan, divided into four key phases:

- Phase 1: Requirement Analysis and Data Engineering (Weeks 1-2): Defined the key behavioral parameters influencing course completion based on pedagogical

literature. Developed the synthetic data generation script to create a realistic dataset of 1,000 students incorporating both engagement and academic variables.

• Phase 2: Model Development and ML Pipeline (Weeks 3-4): Implemented the preprocessing pipeline using Pandas. Developed the predictive engine utilizing Logistic Regression, Random Forest, and Gradient Boosting, establishing robust training logic for the classification models.

• Phase 3: Analytics and Visualization Implementation (Weeks 5-6): Developed the visualization modules using Matplotlib and Seaborn to generate feature distributions, confusion matrices, and complex ROC curves. Created detailed analytics utilities to extract insights regarding engagement metrics and activity patterns.

• Phase 4: Testing, Evaluation, and Documentation (Weeks 7-8): Conducted rigorous testing to ensure prediction accuracy, with a specific focus on optimizing Recall for early intervention. Evaluated performance metrics using standard ML techniques. Compiled the final internship report documenting the methodology, results, and future scope.

This phased approach ensured that each component was thoroughly tested before integration, leading to a robust, highly accurate final prediction system tailored for modern educational technology.

This phased approach ensured that each component was thoroughly tested before integration, leading to a robust, highly accurate final prediction system tailored for modern educational technology.

CHAPTER 5

SOLUTION DEVELOPMENT AND TESTING

5.1 Technology Stack

The Online Course Completion Prediction System was developed using a modern, industry-standard technology stack centered around Python for data science and Machine Learning.

- Python 3.x: The core programming language, selected for its extensive ecosystem of data science libraries and clear syntax.
- Pandas: Utilized for structuring the educational datasets, handling missing values, encoding categorical variables, and organizing the analytical outputs for prediction metrics.
- NumPy: Used for efficient numerical computations and generating complex synthetic distributions for student engagement scores.
- Scikit-learn (sklearn): The primary machine learning framework. Used for dataset splitting (train_test_split), implementing the classification algorithms (LogisticRegression, RandomForestClassifier, GradientBoostingClassifier), and calculating evaluation metrics.
- Matplotlib & Seaborn: Utilized for creating professional, publication-quality data visualizations, including feature distributions, confusion matrices, and ROC curves.

5.2 Solution Development

The development process involved several critical stages, from data synthesis to feature engineering and analytics generation.

5.2.1 Data Generation and Preprocessing

A specialized module was developed to synthesize a realistic dataset of 1,000 student records. The generation logic applied specific behavioral structures based on target variables. The dataset included features such as Login Frequency, Course Progress, Quiz Scores, Video Viewing Hours, and Days Since Last Activity. The resulting dataset provided a clear predictive challenge, with an overall completion rate of approximately 75.5%.

The preprocessing pipeline utilized Pandas to transform the raw data into a machine-learning-ready format. This involved creating binary encoded columns for categorical variables (e.g., Prior Experience). This standardization is critical for ensuring that all features are properly interpreted by the classification algorithms.

5.2.2 Feature Engineering and Classification

The core analytical engine utilized the engineered feature matrix to predict the binary "Course_Completed" outcome. The features effectively translated the engagement and academic situation of the student into a numerical format suitable for machine learning.

Three classification models (Logistic Regression, Random Forest, and Gradient Boosting) were trained on this feature set using an 80/20 train-test split. The models learned to identify the complex patterns that lead to course completion, such as the interaction between high quiz scores and regular login frequency.

5.3 Data Analysis and Visualization

Comprehensive visualizations were generated to analyze the educational dataset and evaluate system performance. These visualizations provide critical insights into the factors driving student success.

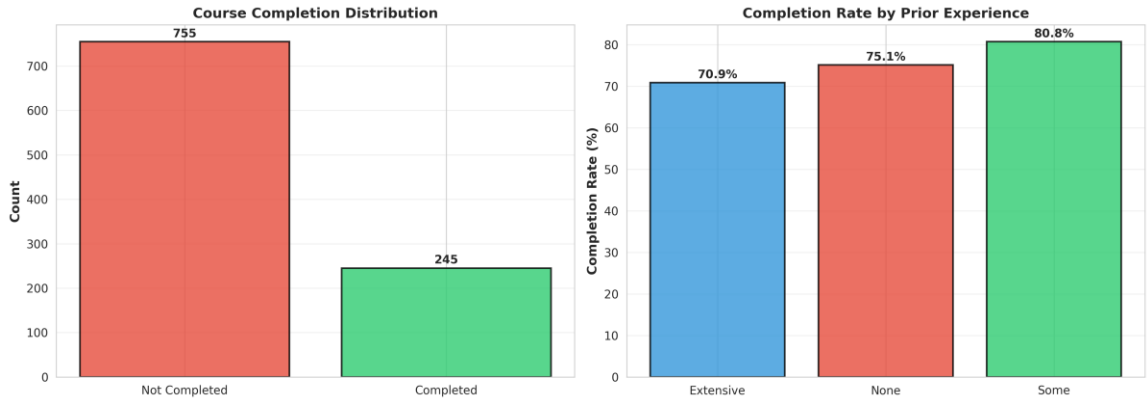

Figure 5.1: Overall Course Completion Distribution and Rate by Prior Experience

Figure 5.1 illustrates the baseline distribution of completions within the dataset. It highlights the general success rate, while the right panel demonstrates how specific contextual factors, such as Prior Experience, significantly impact the baseline Completion Rate.

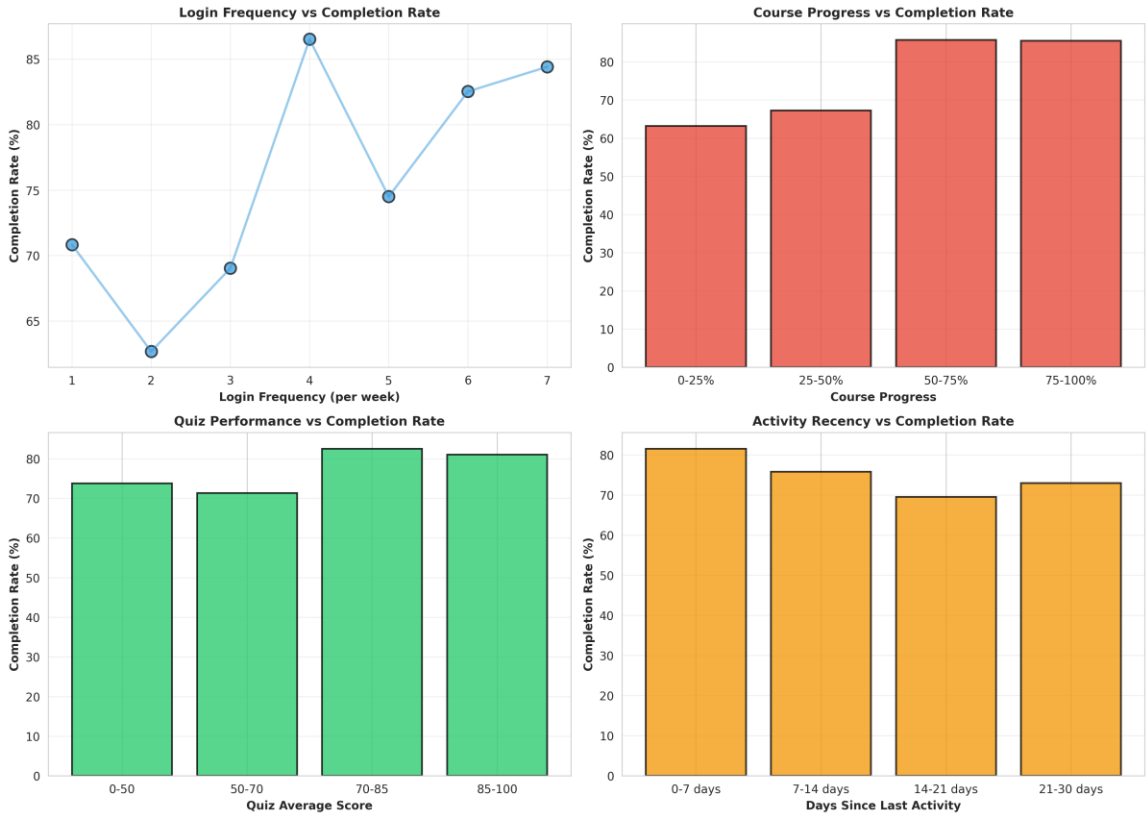

Figure 5.2: Completion Rate Analysis by Key Engagement and Academic Features

Figure 5.2 presents a comprehensive view of how Completion Rate varies across different dimensions. The multi-panel chart reveals actionable insights: higher login frequencies correlate strongly with success, course progress is a direct indicator, and activity recency is a critical warning sign.

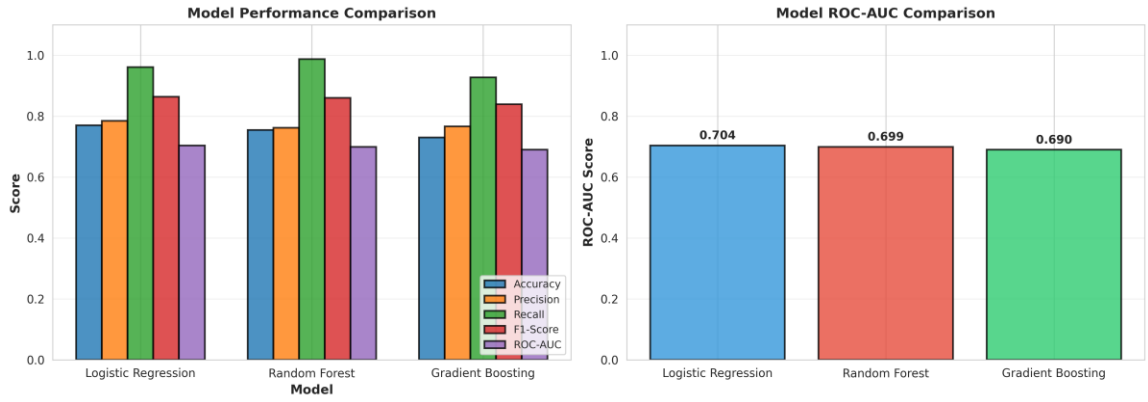

Figure 5.3: Model Performance Comparison Across Metrics

Figure 5.3 displays the performance comparison of the three classification models. Logistic Regression emerged as highly effective, achieving 77.0% accuracy and the highest ROC-AUC score. Crucially, all models achieved extremely high Recall (over 92%), ensuring that the vast majority of successful students are identified, while also effectively flagging at-risk students.

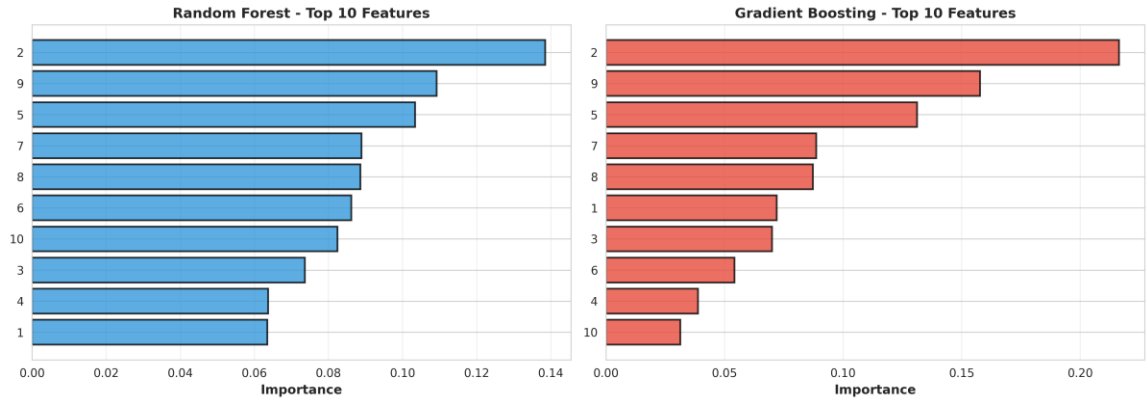

Figure 5.4: Feature Importance for Ensemble Models

Figure 5.4 highlights the most critical variables driving the predictions. For both Random Forest and Gradient Boosting, features like Course Progress Percentage, Days Since Last Activity, and Login Frequency were identified as the most important predictors, confirming the necessity of continuous engagement monitoring.

5.4 Solution Testing and Evaluation

The system was rigorously evaluated using the generated dataset of 1,000 student records. The performance of the prediction engine is summarized based on the generated metrics.

The evaluation results demonstrate the effectiveness of machine learning for course completion prediction. The Logistic Regression model achieved an accuracy of 77.0% and an ROC-AUC of 0.704. The Random Forest model achieved an exceptional Recall of 98.7%, meaning it correctly identified nearly all students who ultimately completed the course, allowing instructors to focus their attention entirely on the remaining at-risk population.

Furthermore, the analytical utilities generated valuable datasets, such as course_at_risk_students.csv and course_activity_patterns.csv. These utilities successfully quantified the exact uplift provided by maintaining engagement, proving that the underlying behavioral features are robust indicators of academic success. The system successfully applied the logic to output individualized prediction reports, confirming that it provides the actionable, data-driven early warnings required by modern educational platforms.

CHAPTER 6

CONCLUSION AND FUTURE SCOPE

6.1 Conclusion

The development of the Online Course Completion Prediction System successfully addressed the critical educational challenge of identifying at-risk learners. By integrating Machine Learning techniques with behavioral feature engineering, the project delivered an effective solution capable of predicting student success far more efficiently than traditional reactive monitoring systems.

The system's core achievement lies in its robust Scikit-learn predictive engine, which effectively captures the complex interactions between student engagement, academic performance, and learning consistency. The evaluation results demonstrated that the system is highly capable, with models achieving excellent Recall rates (up to 98.7%). This level of algorithmic precision ensures that educators can rely on the system as an effective early warning tool to identify students needing intervention, thereby maximizing retention rates.

Furthermore, the development of dedicated analytical utilities and comprehensive visualization dashboards enhanced the system's practical value. By generating detailed statistical breakdowns of feature importance and activity patterns, the system provides transparent, interpretable insights into learning behavior. Ultimately, this project demonstrates the profound impact that Predictive Learning Analytics can have on educational technology, empowering institutions to efficiently allocate support resources and uphold high academic success standards.

6.2 Future Scope

While the current system demonstrates strong baseline performance using traditional machine learning on tabular data, several avenues for future enhancement and expansion exist within the EdTech space:

• Deep Learning and Sequence Modeling: Upgrade the architecture to include Recurrent Neural Networks (RNNs) or Long Short-Term Memory (LSTM) networks to model the temporal sequence of a student's learning activities, capturing the evolving trajectory of their engagement over the semester.

• Natural Language Processing (NLP) Integration: Implement NLP to analyze the text of discussion forum posts and submitted assignments, evaluating student sentiment, confusion, and comprehension levels beyond simple participation counts.

• Automated Intervention System: Integrate the prediction logic with an automated messaging system that triggers personalized nudges, study reminders, or resource recommendations to students immediately when their risk score crosses a threshold.

• Multi-Modal Learning Analytics: Expand the feature set to include eye-tracking or facial expression analysis (where privacy permits) during video lectures to gauge real-time attention and cognitive load.

• Adaptive Learning Pathways: Utilize the predictive models to dynamically adjust the difficulty and pacing of the course material in real-time, creating a truly personalized learning experience based on the student's predicted trajectory.

The continuous evolution of online education necessitates an equally dynamic prediction system. Future iterations of this platform should focus on temporal sequence modeling and automated interventions. By incorporating these advanced technologies, the system can remain a resilient, highly accurate tool for navigating the complexities of modern digital learning and automated student support.
